

34-§ LABORATORIYA ISHI

SUYUQLIKNING SIRT TARANGLIK KOEFFITSIYENTINI ANIQLASH

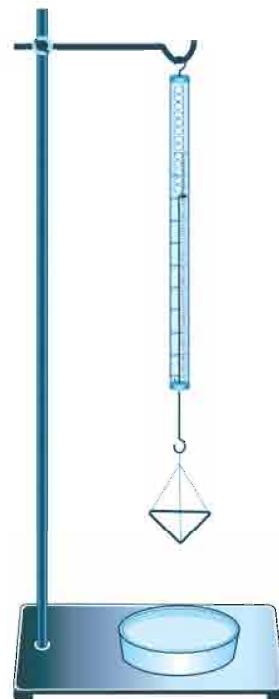

Ishning maqsadi: suyuqlikning sirt taranglik koeffitsiyentini aniqlashni o'rganish.

Kerakli jihozlar: sezgir dinamometr, shtativ, uchburchak, kvadrat va aylana shaklidagi simlar, suv solingan idish, chizg'ich, shtangensirkul.

Ishni bajarish tartibi

1. Dinamometrni shtativga o'rnatning (47-rasm).
2. Chizg'ich yordamida uchburchak shaklidagi simning perimetri l ni o'lchang.
3. Dinamometrning pastki halqasiga uchburchak shaklidagi simni iling va uning og'irlilik kuchi F_1 ni o'lchang.
4. Idishdagi suvni ko'tarib, dinamometrga osilgan simga tekkizing.
5. Idishni sekin pastga tortib, simning suvdan uzilishi paytidagi dinamometrning ko'rsatishi F_2 ni yozib oling.
6. $F = F_2 - F_1$ formuladan sirt taranglik kuchini toping.
7. $\sigma = \frac{F}{2l}$ formula yordamida suvning sirt taranglik koeffitsiyentini hisoblang.
8. Tajribani to'rburchak va aylana shaklidagi simlarda ham bajaring, σ_2 va σ_3 ni hisoblang. $\sigma_{o'n} = \frac{\sigma_1 + \sigma_2 + \sigma_3}{3}$ formula yordamida sirt taranglik koeffitsiyentining o'rtacha qiymatini hisoblang.
9. Tajriba davomidagi o'lhash va hisoblash natijalarini jadvalga yozing.

47-rasm.

1. Sirt taranglik kuchi nimaligini tushuntirib bering.
2. Nima sababdan simni suvdan ajratib olishda kuch kerak bo'ladi?
3. Tajriba natijalarini tahlil qilib, xulosangizni yozib kel.
