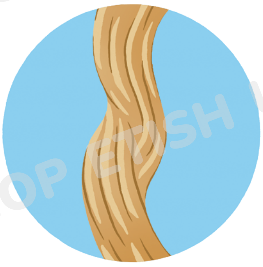
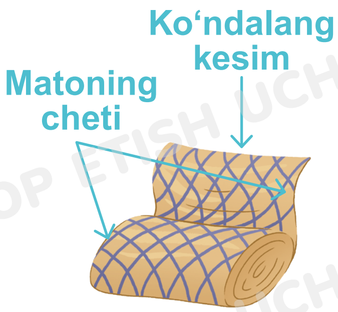
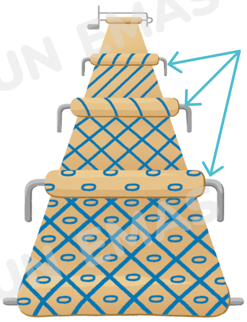
Zig‘ir tolasini ishlab chiqarish

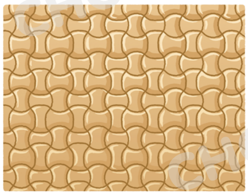
Oldin zig‘ir o‘riladi va poyasi yig‘ishtirib olinadi. Bu jarayon mashina yordamida amalga oshiriladi. Zavodda zig‘ir poyasining yog‘och qismi olib tashlanadi va tozalanmagan zig‘ir tolasi ajratib olinadi. Tolani bir butun qilib qayta-qayta taraladi, natijada uzunligi 0,5 metrgacha bo‘lgan zig‘ir tolalari hosil bo‘ladi. Keyin tola cho‘ziladi va ingichkalashadi. Olinayotgan ip “xom ip” deyiladi, so‘ng xom ip u g‘altakka o‘raladi va qaynatishga, bo‘yashga yoki oqartirishga jo‘natiladi. Shundan so‘ng cho‘zadigan asbob yordamida ipni suvga solib yana cho‘ziladi va eshilgan ip hosil bo‘ladi. Bu ipdan gazlama to‘qiladi.

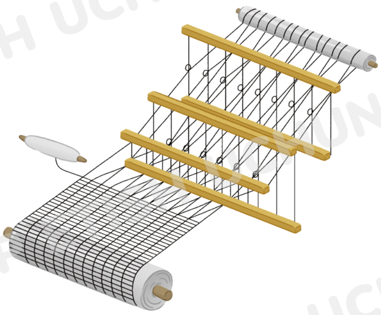


Dastlabki ishlov → Tozalangan tola → Eshilgan ip (burash) → Yigirish









To‘qish (iplarni to‘qish) → Xom mato → Matoga ishlov berish → Tayyor mato

CHOP ETISH UCHUN EMAS

Paxtadan qanday qilib eshilgan ip ishlab chiqarilishini eslang va gapirib bering.
